Session 1 Guide:

Step 1: Log In to GitHub Using Your Google Account

1. Open your browser and navigate to the GitHub login page: github.com/login
2. Beneath the standard username/password fields, click the button that says "Continue with Google" (or select the Google icon).
3. A popup/prompt will appear—choose the Google account you want to use.
4. If this is your first time logging in with this Google account:
    - Google will ask you to authorize GitHub. Click Continue / Authorize GitHub.
    - If you don't have an existing GitHub account linked to that email, GitHub will ask you to quickly confirm your desired Username and accept the terms of service.
5. Once authenticated, you will be redirected straight to your GitHub Dashboard.

Step 2: Create a New Repository

1. Once on your GitHub dashboard, locate and click the + (plus icon) in the top-right corner of the page next to your profile picture.
2. Click "New repository" from the drop-down menu. *(Alternatively, click the green "New" button on the left panel)*.
3. Fill in the repository details:
    - Repository name: Type a name for your project (e.g., girls-to-code-2026).
    - Description *(Optional)*: Briefly describe what your project does.
    - Visibility: Choose between:
        - Public: Anyone on the internet can view your repository.
        - Private: Only you (and people you explicitly invite) can view it.
4. Initialize the repository (Recommended):
    - Check "Add a README file" (this provides a space to write documentation for your project).
5. Click the green "Create repository" button at the bottom of the form.

Your repository is now created! You will be taken directly to your new repository page where you can upload files, add code, or share the repository link with others.

Part 2: Comprehensive HTML5 Tags Reference Table

Tag	Description	Self-Closing?	Code Example
<!DOCTYPE html>	Declares the document type and HTML version (HTML5).	Yes	<!DOCTYPE html>
